

Classroom Spaces Guide

Featuring HPR-SL, HP-4 D & HP-2 WW

Comprehensive instructions for incorporating Finelite HPR-SL, HP-4 D, and HP-2 WW luminaires seamlessly with Wattstopper lighting controls.

The goal of this guide is to equip you to design effective lighting solutions for various K-12 classroom projects. Inside, you'll find clear lighting and control diagrams that showcase control integration possibilities.

Wired - Stand Alone

Occupancy, Manual Control

Design Scenario:

- Each fixture is equipped with an LMFC-011 DLM in-fixture control device to provide luminaire-level lighting control in the space
- LMPB-100 provides power to in-fixture controls and other DLM devices.
- LMDC-100 provides occupancy sensing to automatically
- Turn any lighting on or off.
- LMSW-241 provides manual on, off, and dimming control with scene control for quick adjustments to certain room states.

LMPB-100
Power Supply for all devices
150mA limit per

LMSW-241
Dimmer to control all zones
Current consumption 7mA

LMCT-100-2
DLM Hand Held Programmer

Wired - Stand Alone

Occupancy, Daylight, Manual Control

Design Scenario:

- LMLS-500 provides daylight reactive control by establishing up to three lighting zones using daylight harvesting. The example shown utilizes two zones (primary, secondary), with a third non-daylit zone.
- LMSW-241 provides a single-zone control experience while the LMLS-500 automates zone-based daylight harvesting without user interactions.

Dual Tech Occupancy Sensor (1,000 sqft)
Current consumption: 20mA

LMSW-241
Dimmer to control all zones
Current consumption 7mA

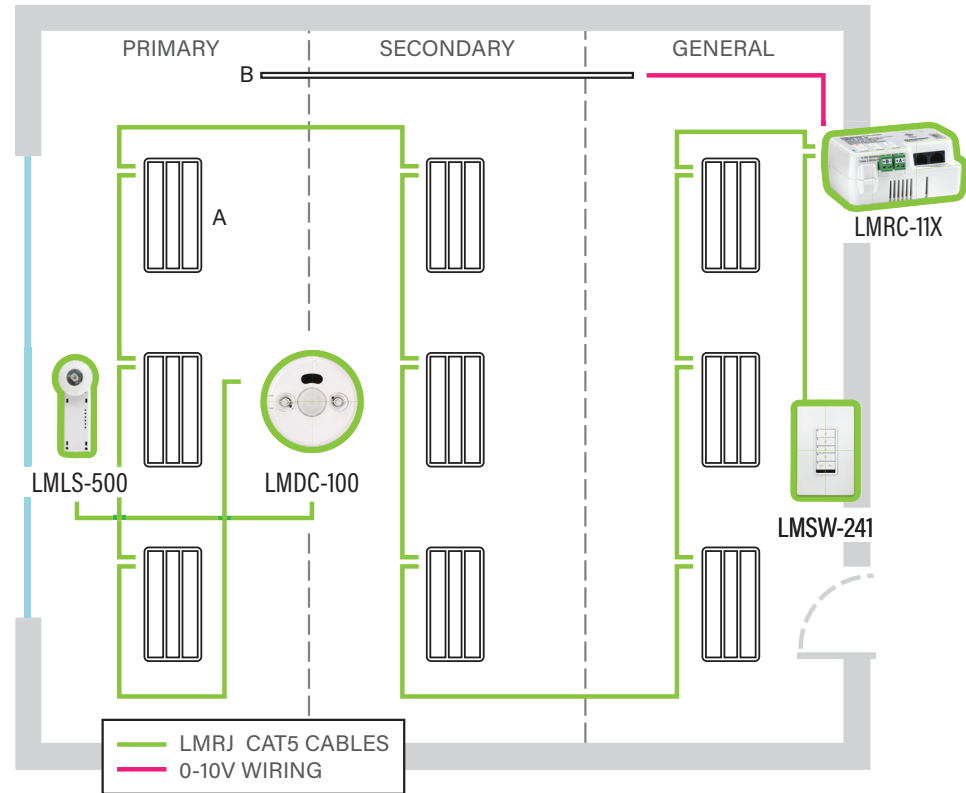

LMLS-500
Open loop daylight sensor

Wired - Stand Alone

Occupancy, Daylight, Manual Control

Design Scenario:

- When fixtures without LMFC-011 integrated controls are required, the LMPB-100 Power Booster may be substituted with an LMRC-11X Room Controller in order to integrate control of the fixture in the room.
- Any fixtures connected to an LMRC-11X Room Controller operate at the same output level and may be programmed to operate identically or differently than the LMFC-011 enabled fixtures in the space.

Current consumption: 7mA

LMLS-500
Open loop daylight sensor
Current consumption: 20mA

Wired - Networked

Occupancy, Daylight, Manual Control

Design Scenario:

- When rooms of LMFC-011 enabled fixtures require more advanced functionality such as time clock or demand responsive control, rooms may be networked to each other and to a system manager device (LMJA-8000-SM) by adding an LMBC-300 Bridge Controller to each room.
- LMBC-300 bridges connect to each other via an RS-485 MS/TP daisy chain which ultimately connects to the LMJA-8000-SM for system network communications.

Wireless - Stand Alone

Occupancy, Daylight, Manual Control

Design Scenario:

- Each fixture is equipped with an LMFS-601 DLM in-fixture control and sensor device to provide luminaire-level lighting control in the space.
- The LMFS-601's built-in occupancy sensor provides occupant sensing to automatically turn any lighting on or off at either an individual-fixture or group level.
- The LMFS-601's built-in daylight sensor provides daylight reactive control for each LMFS-equipped fixture within the same daylight zone.
- LMSW-641-S provides manual on, off, and dimming control with scene control for quick adjustments to certain room states while the LMFS-601 daylight sensor automates zone-based daylight harvesting without user interactions.

DLM Configuration App

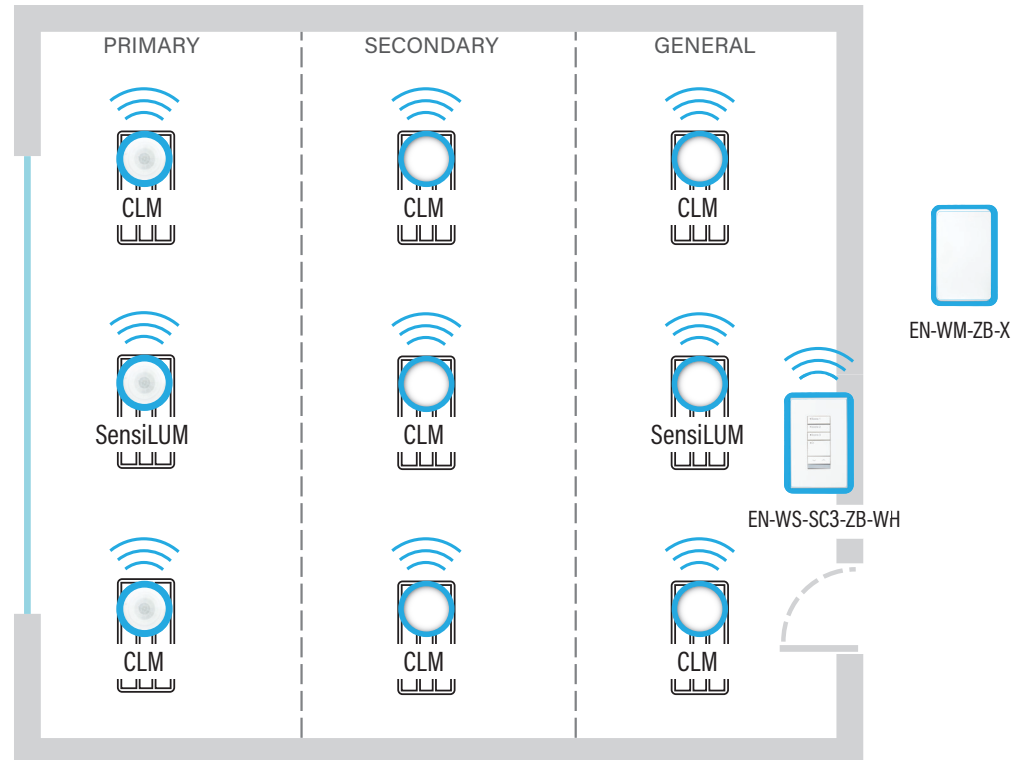

Wireless - Networked

Occupancy, Daylight, Manual Control

Design Scenario:

- Primary & General fixtures are equipped with CLM and SensiLUM in-fixture controls to provide luminaire-level lighting control in the space.
- The SensiLUM built-in occupancy sensor provides occupant sensing to automatically turn any lighting on or off at either an individual-fixture or group level.
- The SensiLUM built-in daylight sensor provides daylight reactive control for each LMFS-equipped fixture within the same daylight zone.
- EN-WS-SC3-ZB-WH provides manual on, off, and dimming control with scene control for quick adjustments to certain room states while the daylight sensor automates zone-based daylight harvesting without user interactions.

One Wireless manager (EN-WM-ZB-X) is required to control up to 100 devices across multiple classrooms.
